

THE UNIVERSITY OF BRITISH COLUMBIA

Security Policies

EECE 412
Session 11

Copyright © 2004 Konstantin Beznosov

Last Topic Recap

- Content
 - Authentication system definition
 - Password-based authentication
 - Challenge-response authentication
 - S/Key one-time password system
 - Biometric authentication
 - Multi-factor authentication
 - Ways to break and improve authentication systems
- Key points
 - Authentication is not just about cryptography
 - You have to consider system components
 - Passwords are here to stay
 - They provide a basis for most forms of authentication
 - Two or three -factor authentication is the best yet more expensive

UBC

Outline

- Access control mechanisms
- Access Matrix
- Security policies
 - Confidentiality policies
 - Bell LaPadula confidentiality model

UBC

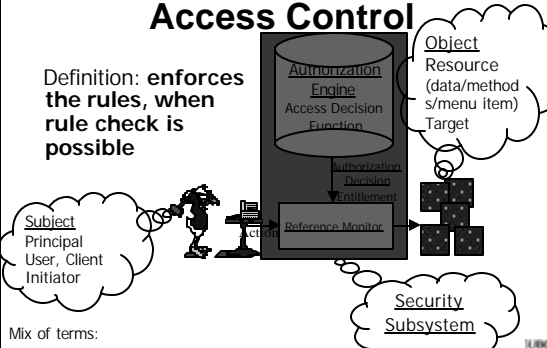

Where We Are

		Protection					
		Authorization	Accountability	Availability			
Access Control	Data Protection	Audit		Service Continuity	Disaster Recovery		
	Authentication		Cryptography				

UBC

Authorization Mechanisms: Access Control

Definition: **enforces the rules, when rule check is possible**

Subject
Principal
User, Client
Initiator

Authorization Engine
Access Decision
Function

Reference Monitor

Object
Resource
(data/method
s/menu item)
Target

Security Subsystem

Mix of terms:
 5 Authorization == Access Control Decision
 6 Authorization Engine == Policy Engine

Access Matrix

Copyright © 2004 Konstantin Beznosov

Example

- Processes p, q
- Files f, g
- Rights r, w, x, a, o

	f	g	p	q
p	rwo	r	$rwXO$	w
q	a	ro	r	$rwXO$

- ### Matrix Implementation Techniques
1. $T = \{ \langle d, XA_{d,x} \rangle \}$ – impractical
 - a) Only relevant parts of A need to be handy
 - b) Could be very inefficient for some A s (e.g. public files)
 - c) List of objects to which d has access
 2. Capability = $\langle XA_{d,x} \rangle$
 - C-lists
 - Attach C-list to domains
 - Addresses (a), (c) and potentially (b)
 3. attach the protection information to the object: $A_x(d)$
 - Access key – capability used for identification, (credential)
 - $\{ \langle \text{access key}, \{ \text{access attributes} \} \rangle \}$ – access control list (ACL)

- ### Group Work
- ACLs are good for revoking individual's access to a particular file.
- How hard is it to revoke a user's access to a particular set of files, but not to all files, with ACLs?
 - Compare and contrast this with the problem of revocation using capabilities.

- ### Access Matrix Summary
- Object System
 - Subjects, objects, access matrix
 - Objects are shared
 - All subjects are objects
 - not all objects are subjects
 - Matrix modification rules
 - Matrix implementation
 - Capability lists
 - Access control lists

Security Policies

Copyright © 2004 Konstantin Beznosov

What's Security Policy?

- Policy partitions system states into:
 - Authorized (secure)
 - These are states the system can enter
 - Unauthorized (nonsecure)
 - If the system enters any of these states, it's a security violation
- Secure system
 - Starts in authorized state
 - Never enters unauthorized state
- Authorized state in respect to what?

What's Confidentiality?

- X set of entities, I information
- I has *confidentiality* property with respect to X if no $x \in X$ can obtain information from I
- I can be disclosed to others
- Example:
 - X set of students
 - I final exam answer key
 - I is confidential with respect to X if students cannot obtain final exam answer key

What's Integrity?

- X set of entities, I information
- I has *integrity* property with respect to X if all $x \in X$ trust information in I
- *Examples?*

Types of Access Control

- Discretionary Access Control (DAC, IBAC)
 - individual user sets access control mechanism to allow or deny access to an object
- Mandatory Access Control (MAC)
 - system mechanism controls access to object, and individual cannot alter that access
- Originator Controlled Access Control (ORCON)
 - originator (creator) of information controls who can access information

Question

- Policy disallows cheating
 - Includes copying homework, with or without permission
- A class has students do homework on computer
- Alice forgets to read-protect her homework file
- Bob copies it
- Who cheated?
 - Alice, Bob, or both?

Answer

- Bob cheated
 - Policy forbids copying homework assignment
 - Bob did it
 - System entered unauthorized state (Bob having a copy of Anne's assignment)
- If not explicit in computer security policy, certainly implicit
 - Not credible that a unit of the university allows something that the university as a whole forbids, unless the unit explicitly says so

19

Answer Part #2

- Alice didn't protect her homework
 - Not required by security policy
- She didn't breach security
- If policy said students had to read-protect homework files, then Alice did breach security
 - She didn't do this

20

Key Points about Policies and Mechanisms

- Policies describe what is allowed
- Mechanisms control how policies are enforced

21

THE UNIVERSITY OF BRITISH COLUMBIA

Confidentiality Policies

Copyright © 2004 Konstantin Beznosov

What's Confidentiality Policy

- Goal: prevent the unauthorized disclosure of information
 - Deals with information flow
 - Integrity incidental
- Multi-level security models are best-known examples
 - Bell-LaPadula Model basis for many, or most, of these

23

Bell-LaPadula Model, Step 1

- Security levels arranged in linear ordering
- Example:
 - Top Secret: highest
 - Secret
 - Confidential
 - Unclassified: lowest
- Subjects have *security clearance* $L(s)$
- Objects have *security classification* $L(o)$

24

Example

security level	subject	object
Top Secret	Alice	Personnel Files
Secret	Bob	E-Mail Files
Confidential	Chiang	Activity Logs
Unclassified	Fred	Telephone Lists

- Alice can read all files
- Chiang cannot read Personnel or E-Mail Files
- Fred can only read Telephone Lists

Reading Information

- Information flows *up*, not *down*
 - “Reads up” disallowed, “reads down” allowed
- Simple Security Property
 - Subject s can read object o iff, $L(o) = L(s)$ and s has permission to read o
 - Note: combines mandatory control (relationship of security levels) and discretionary control (the required permission)
 - Sometimes called “no reads up” rule

Writing Information

- Information flows up, not down
 - “Writes up” allowed, “writes down” disallowed
- *-Property
 - Subject s can write object o iff $L(s) = L(o)$ and s has permission to write o
 - Note: combines mandatory control (relationship of security levels) and discretionary control (the required permission)
 - Sometimes called “no writes down” rule

Bell-LaPadula Model, Step 2

- Expand notion of security level to include categories
- Security level is *(clearance, category set)*
- Examples
 - (Top Secret, { NUC, EUR, ASI })
 - (Confidential, { EUR, ASI })
 - (Secret, { NUC, ASI })

Levels and Lattices

- (A, C) dominates (A', C') iff $A' = A$ and $C \subseteq C'$
- Examples
 - (Top Secret, {NUC, ASI}) *dom* (Secret, {NUC})
 - (Secret, {NUC, EUR}) *dom* (Confidential, {NUC, EUR})
 - (Top Secret, {NUC}) *not dom* (Confidential, {EUR})
- Let C be set of classifications, K set of categories. Set of security levels $L = C \times K$, *dom* form lattice

- ### Levels and Ordering
- Security levels partially ordered
 - Any pair of security levels may (or may not) be related by *dom* relation
 - Note:
 - “dominates” serves the role of “greater than”
 - “greater than” is a total ordering, though

- ### Reading Information
- Information flows *up*, not *down*
 - “Reads up” disallowed, “reads down” allowed
 - Simple Security Property (Step 2)
 - Subject *s* can read object *o* iff $L(s) \text{ dom } L(o)$ and *s* has permission to read *o*
 - Note: combines mandatory control (relationship of security levels) and discretionary control (the required permission)
 - Sometimes called “no reads up” rule

- ### Writing Information
- Information flows up, not down
 - “Writes up” allowed, “writes down” disallowed
 - *-Property (Step 2)
 - Subject *s* can write object *o* iff $L(o) \text{ dom } L(s)$ and *s* has permission to write *o*
 - Note: combines mandatory control (relationship of security levels) and discretionary control (the required permission)
 - Sometimes called “no writes down” rule

- ### Problem
- Colonel has (Secret, {NUC, EUR}) clearance
 - Major has (Secret, {EUR}) clearance
 - Major can talk to colonel (“write up” or “read down”)
 - Colonel cannot talk to major (“read up” or “write down”)
 - Clearly absurd!

- ### Solution
- Define maximum, current levels for subjects
 - $\text{maxlevel}(s) \text{ dom } \text{curlevel}(s)$
 - Example
 - Treat Major as an object (Colonel is writing to him/her)
 - Colonel has $\text{maxlevel}(\text{Secret}, \{ \text{NUC}, \text{EUR} \})$
 - Colonel sets curlevel to (Secret, { EUR })
 - Now $L(\text{Major}) \text{ dom } \text{curlevel}(\text{Colonel})$
 - Colonel can write to Major without violating “no writes down”

Key Points Regarding Confidentiality Policies

- Confidentiality policies restrict flow of information
- Bell-LaPadula model supports multilevel security
 - Cornerstone of much work in computer security

37

Next Session Preview

- Integrity policies
 - Biba integrity model
 - Clark-Wilson integrity model
- Hybrid policies
 - Chinese Wall model
 - Role-based access control model

38
