

THE UNIVERSITY OF BRITISH COLUMBIA

Access Control

EECE 412

learning objectives

you should be able to

explain confidentiality and integrity in terms of security policies

explain c-lists and ACLs and differences between the two

explain main access control poly models (BLP, CW, RBAC, DAC)

convert a policy from one model to another

Where We Are

Protection					Assurance				
Authorization		Accountability		Availability		Requirements Assurance	Design Assurance	Development Assurance	Operational Assurance
Access Control	Data Protection	Audit		Service Continuity	Disaster Recovery				
		Non-Repudiation							
Authentication									
Cryptography									

Ross
Anderson

“If you say that your problem can be solved with cryptography, then you don't understand your problem and you don't understand cryptography.”

Roger
Needham

Authorization Mechanisms: Access Control

Definition: **enforces the rules,
when rule check is
possible**

Subject
Principal
User, Client
Initiator

Action

**Authorization
Engine**

Target

A diagram consisting of four overlapping rectangles of varying sizes and positions, representing object resources or targets.

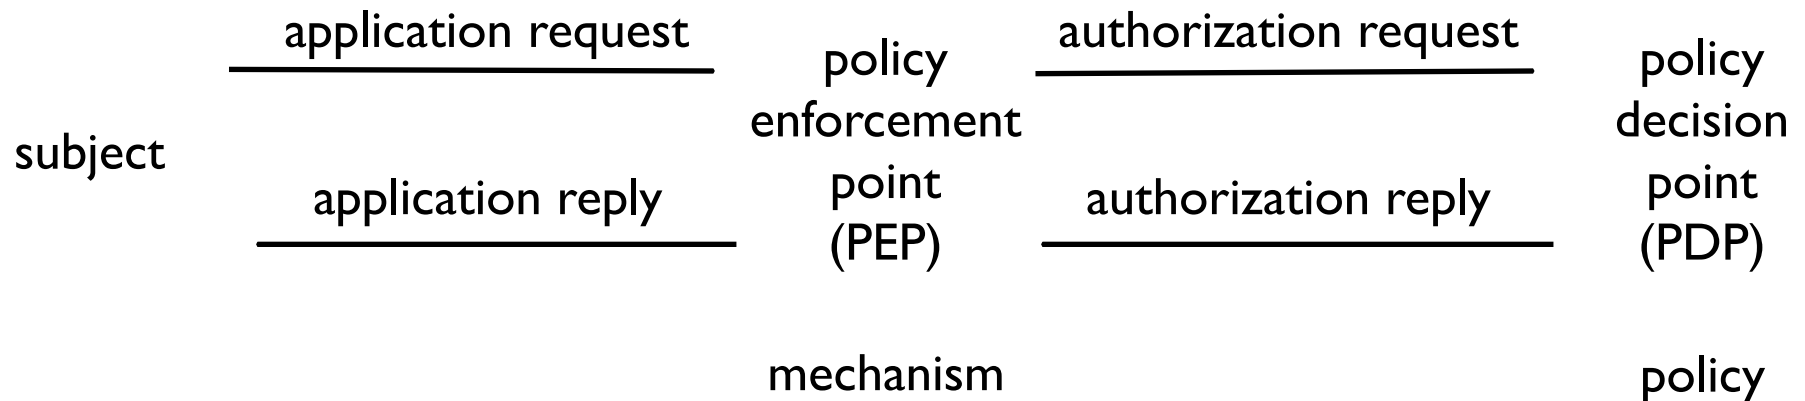

Mix of terms:

Authorization == Access Control Decision
Authorization Engine == Policy Engine

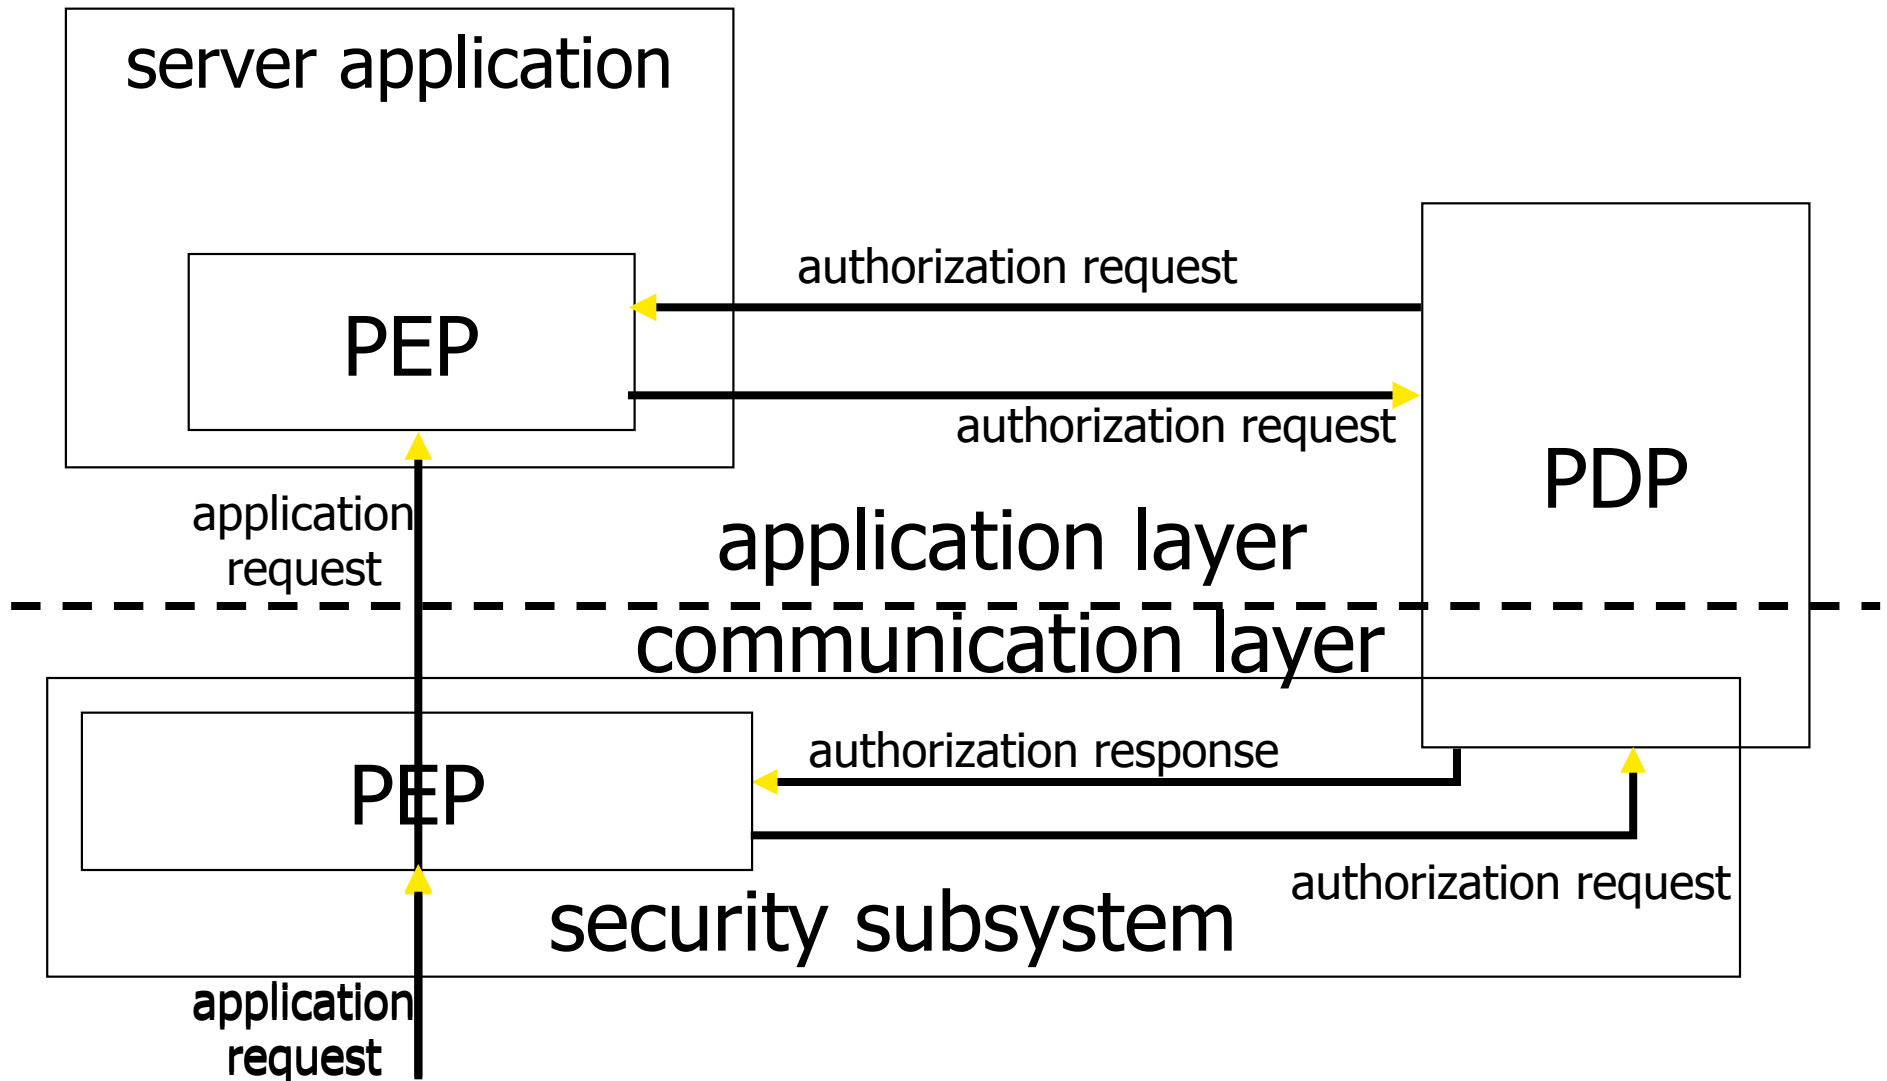

policies and mechanisms

Policies describe what is allowed

Mechanisms control how policies are enforced

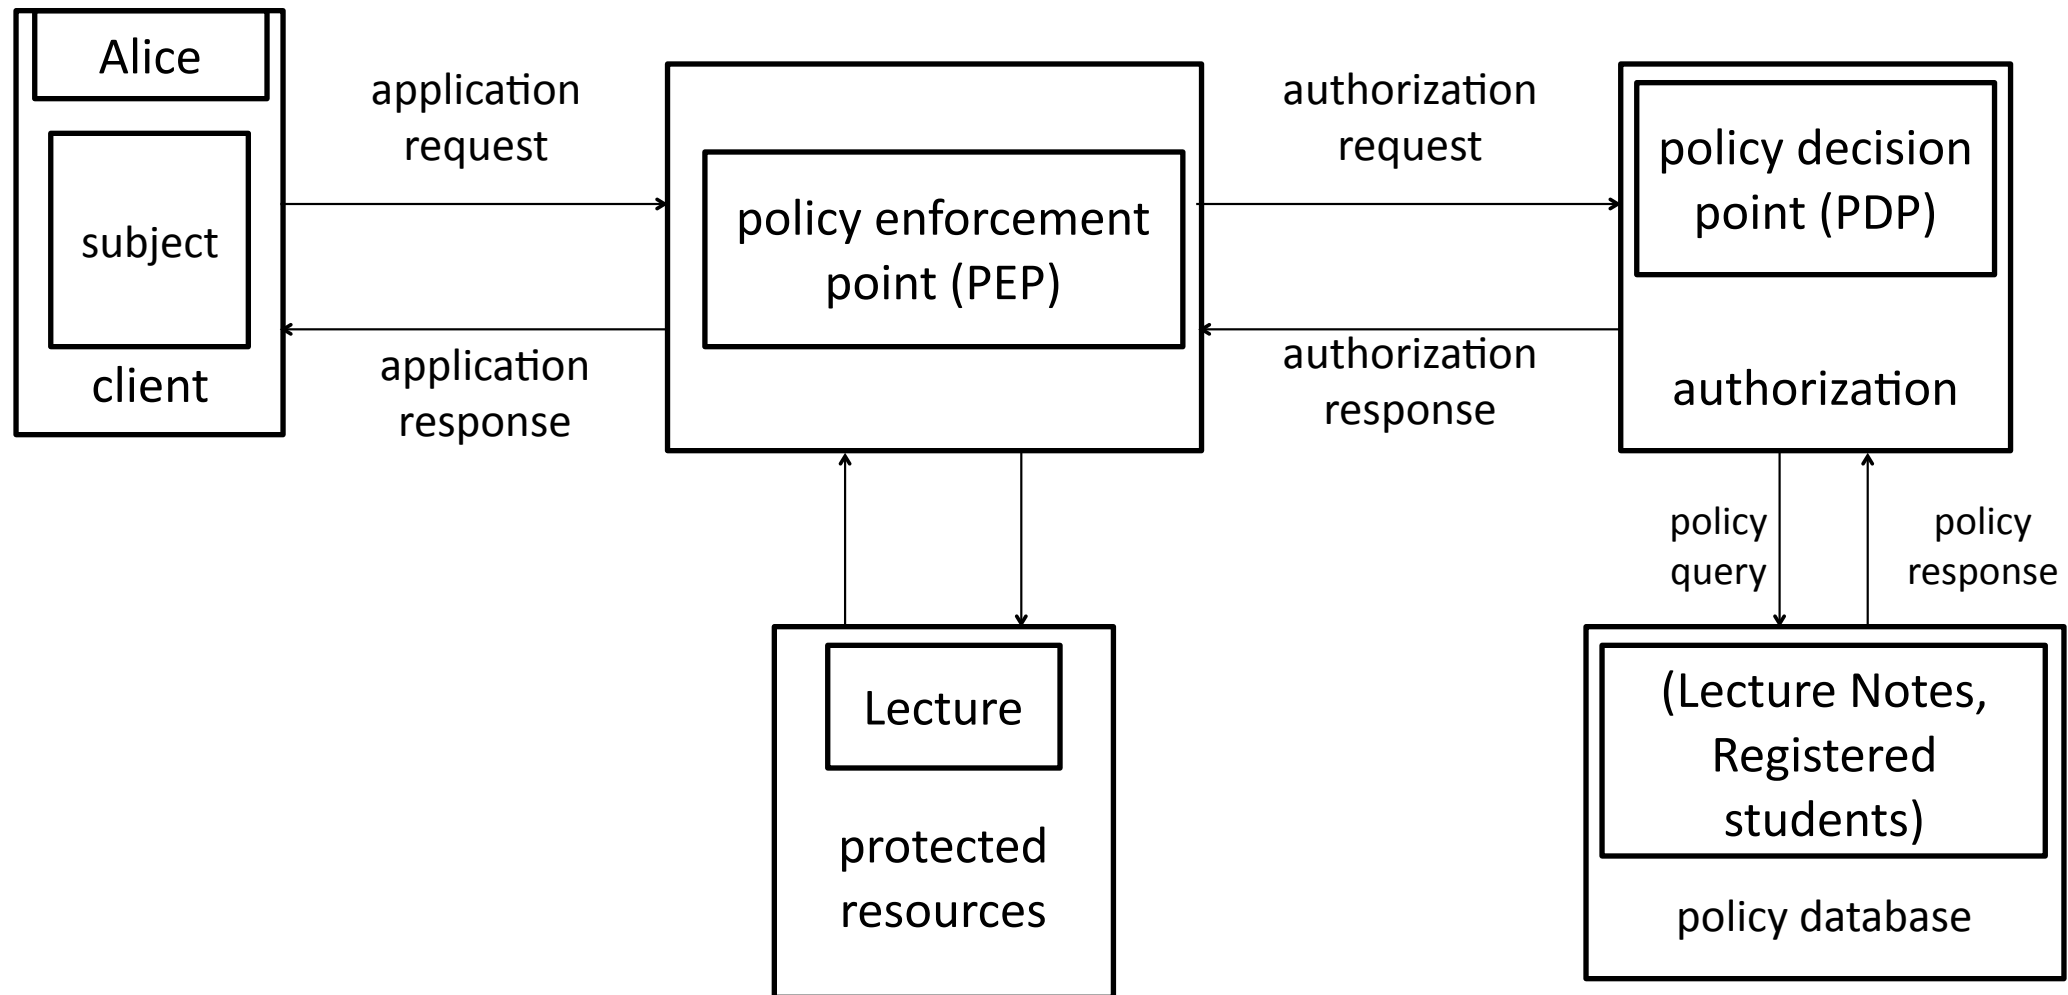

request-response paradigm

case study of research @
LERSSE:

improving performance and
availability of enterprise
authorization architectures

authorization architecture

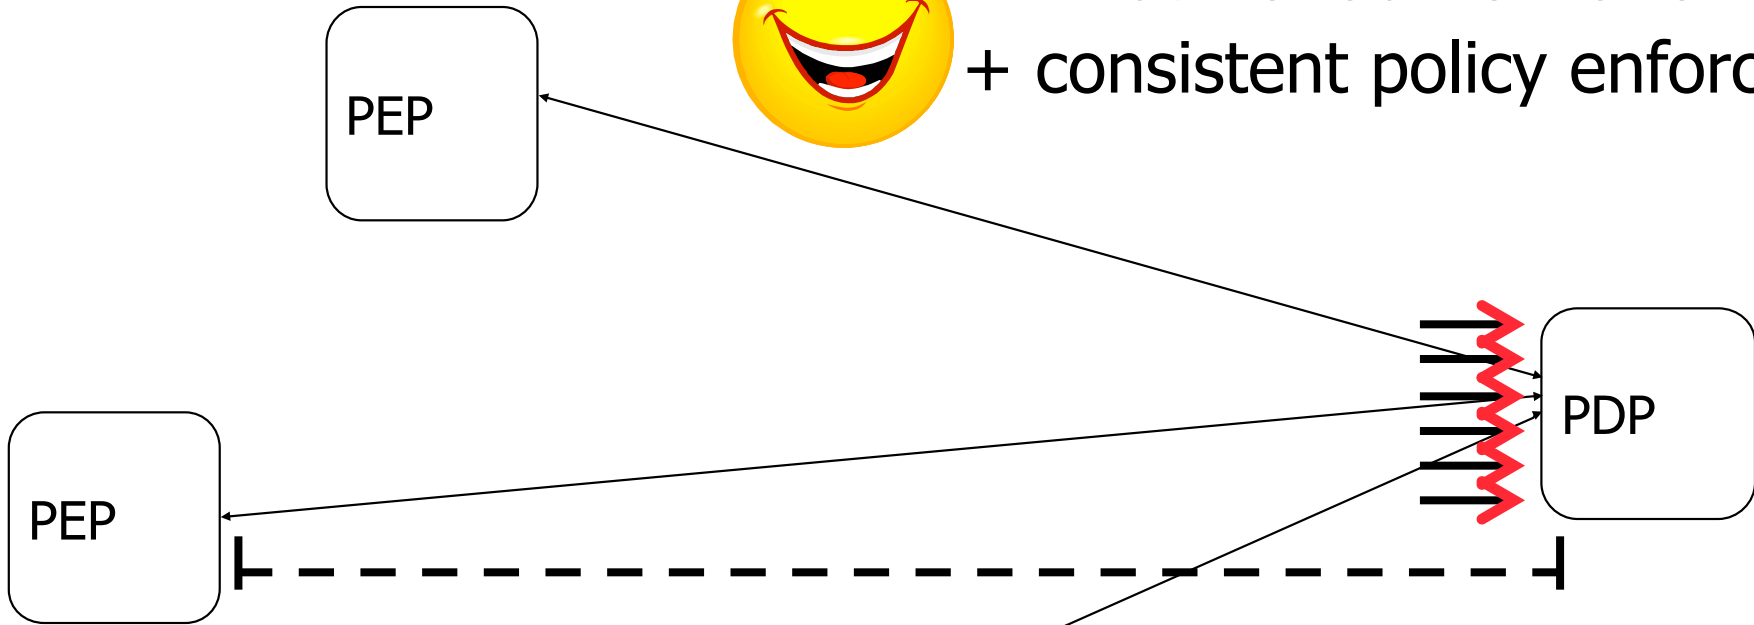

- also known as the request-response model
- used by IBM Access Manager, Entrust GetAccess, CA SiteMinder

pros and cons

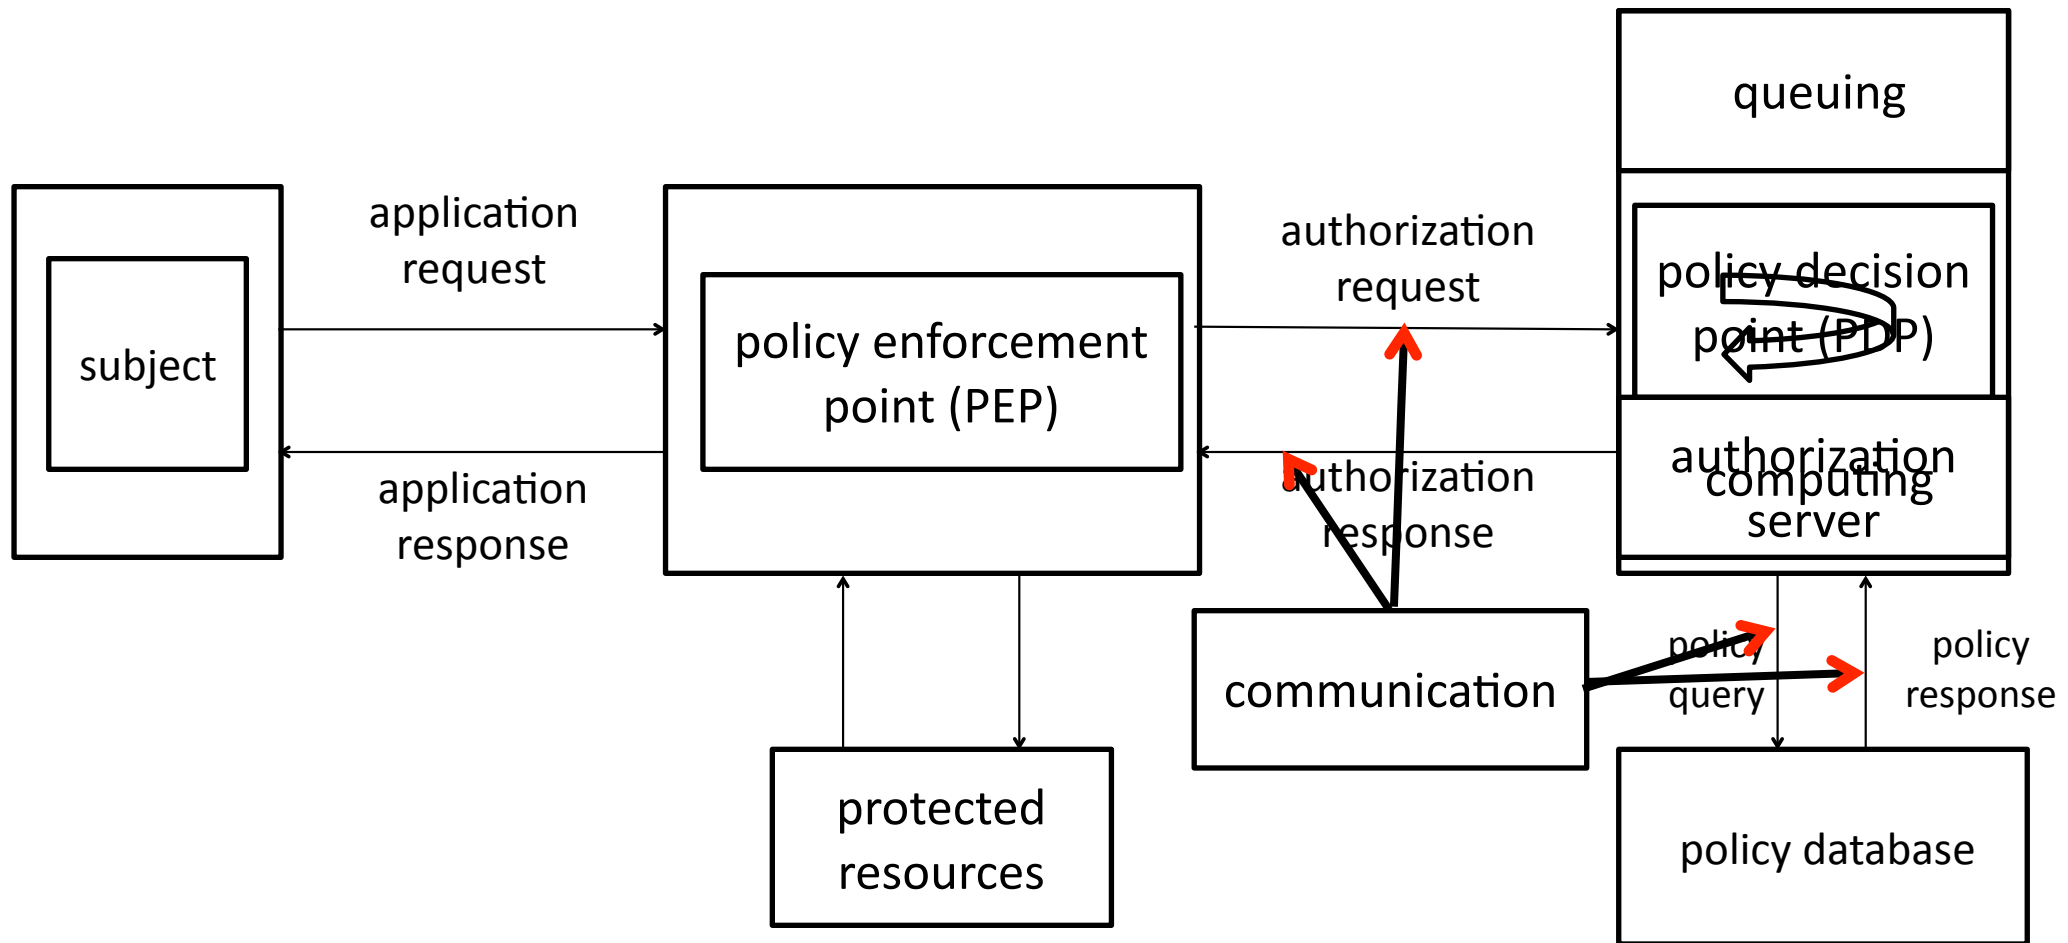

- + re-use of authorization logic
- + consistent policy enforcement

- reduced availability
- increased latency
- reduced scalability

problem – authorization latency

authorization latency is the sum of the three delays

existing approaches

➤ group replication

- + reduces the queuing delays
- require specialized OS/middleware
- poorly scale on large populations
- communication delays still exist

➤ caching previous authorizations

- + simple, inexpensive
- + improves overall latency
- serves only returning requests

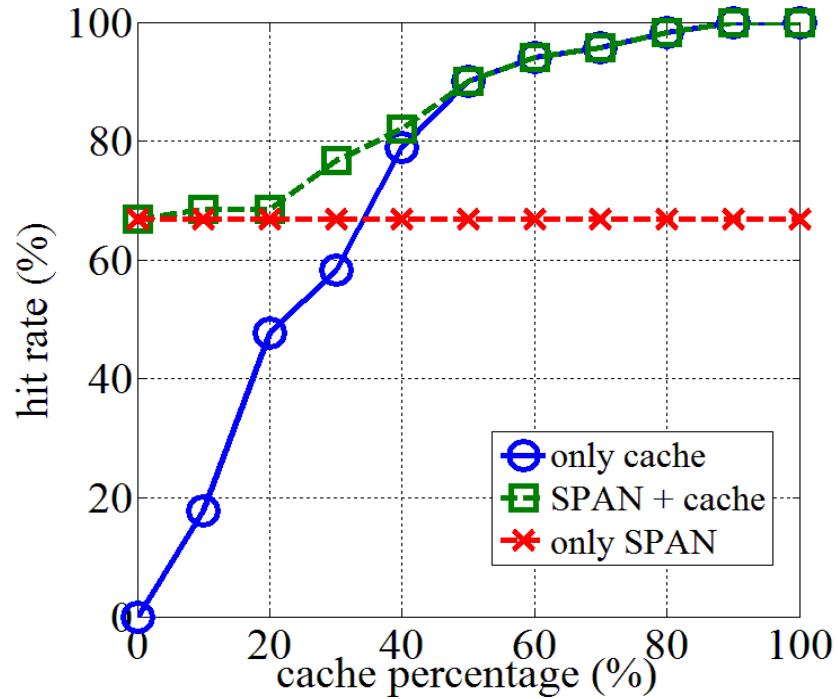

➤ SAAM and its variants [1, 2]

- + improve availability and performance
- delay incurred for computing responses remains unchanged
- designed for policies that are defined using the BLP model.

THE UNIVERSITY OF BRITISH COLUMBIA

Access Matrix

Lampson's Access Control Matrix

Subjects (users) index the rows

Objects (resources) index the columns

	OS	Accounting program	Accounting data	Insurance data	Payroll data
Bob	rx	rx	r	---	---
Alice	rx	rx	r	rw	rw
Sam	rwX	rwX	r	rw	rw
Accounting program	rx	rx	rw	rw	rw

why access matrix is not used

Access control matrix has all relevant info

But how to manage a large access control (AC) matrix?

Could be 1,000's of users, 1,000's of resources

Then AC matrix with 1,000,000's of entries

Need to check this matrix before access to any resource is allowed

Hopelessly inefficient

Access Control Lists

ACL: store access control matrix by **column**

Example: ACL for **insurance data** is in **yellow**

	OS	Accounting program	Accounting data	Insurance data	Payroll data
Bob	rx	rx	r	---	---
Alice	rx	rx	r	rw	rw
Sam	rwX	rwX	r	rw	rw
Accounting program	rx	rx	rw	rw	rw

example: MacOS X

```

```

Capabilities (or C-Lists)

Store access control matrix by **row**

Example: Capability for **Alice** is in **blue**

	OS	Accounting program	Accounting data	Insurance data	Payroll data
Bob	rx	rx	r	---	---
Alice	rx	rx	r	rw	rw
Sam	rwX	rwX	r	rw	rw
Accounting program	rx	rx	rw	rw	rw

introduction → evaluation → recommendation → conclusion

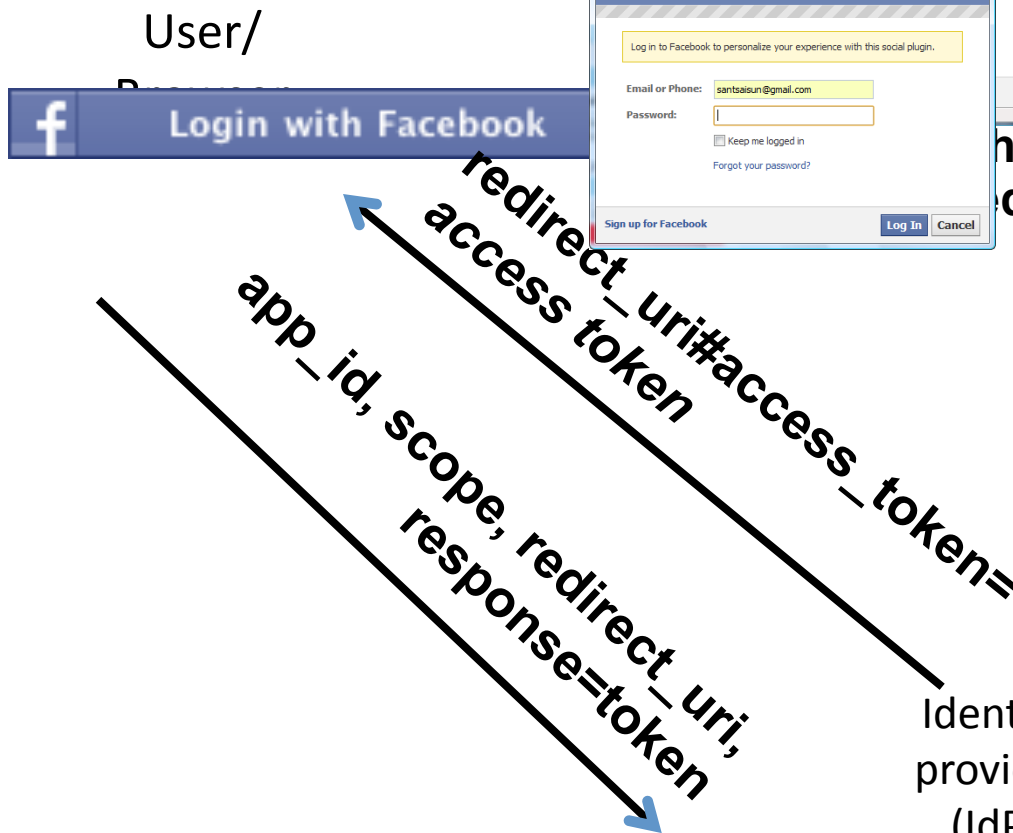

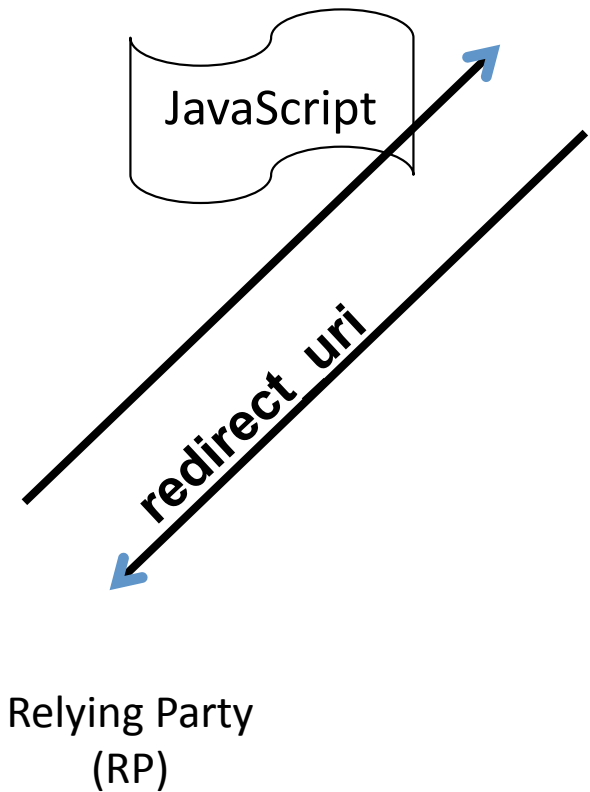

example: OAuth v2

`access_token = document.location.hash`

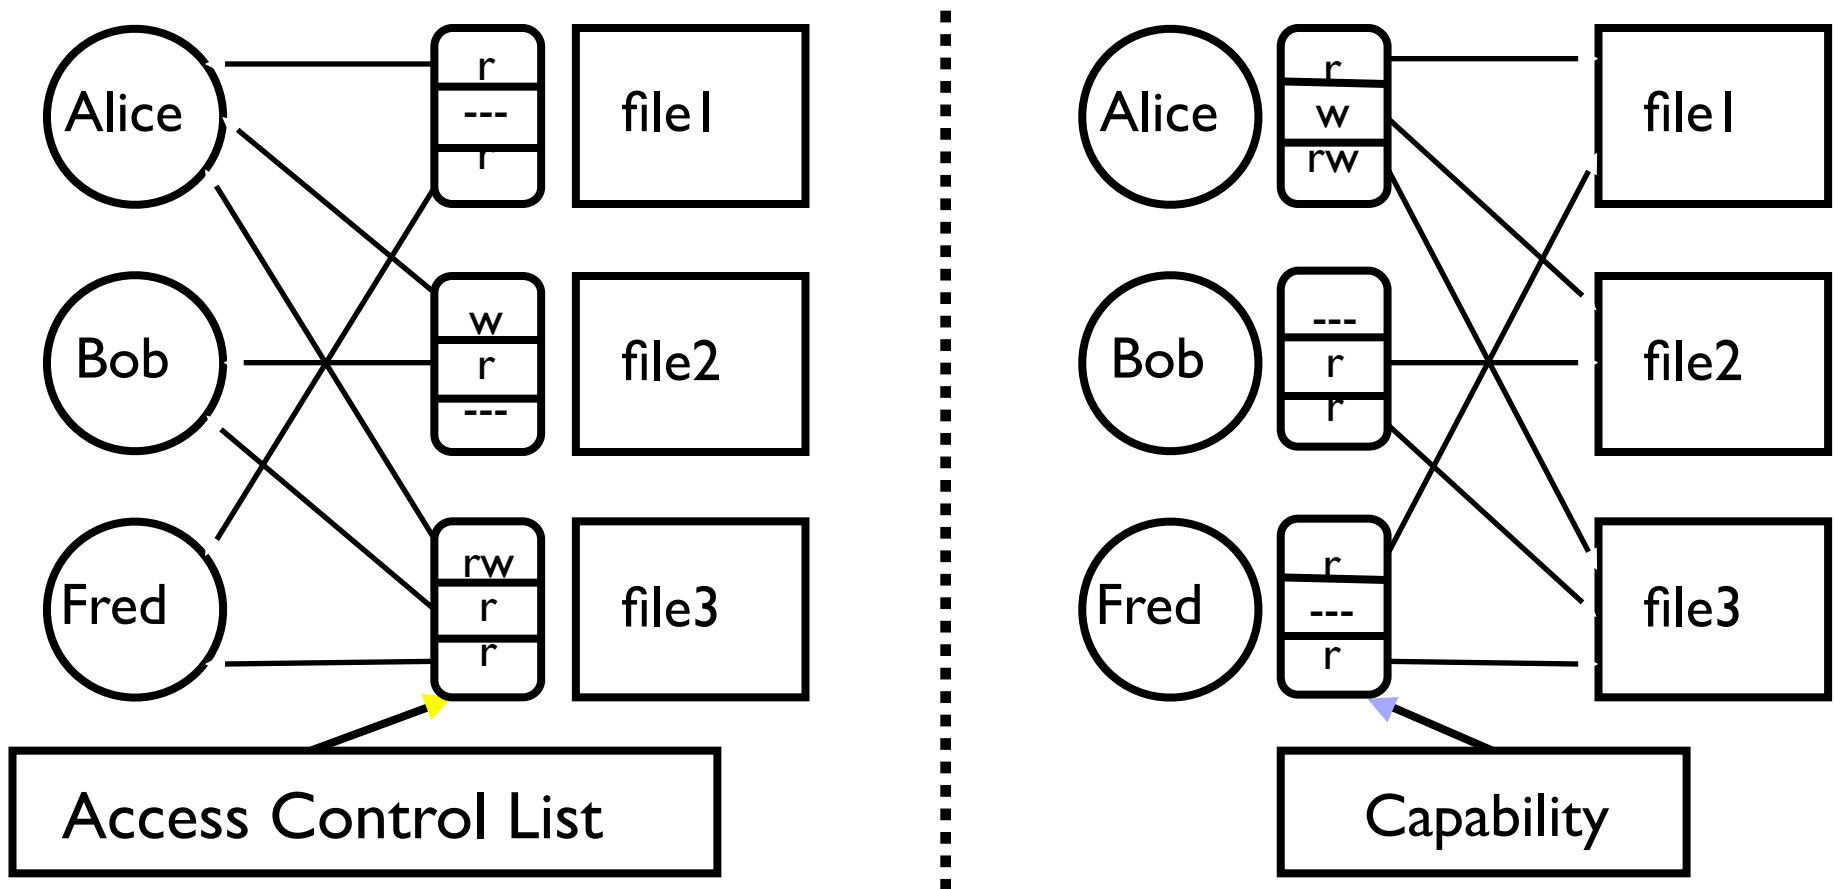

skip authentication if user has logged into the IdP in the browser

authorization if already

ACLs vs Capabilities

Note that arrows point in opposite directions!

With ACLs, still need to associate users to files

ACLs vs Capabilities

ACLs

Good when users manage their own files

Protection is data-oriented

Easy to change rights to a resource

Capabilities

Easy to delegate

Easy to add/delete users

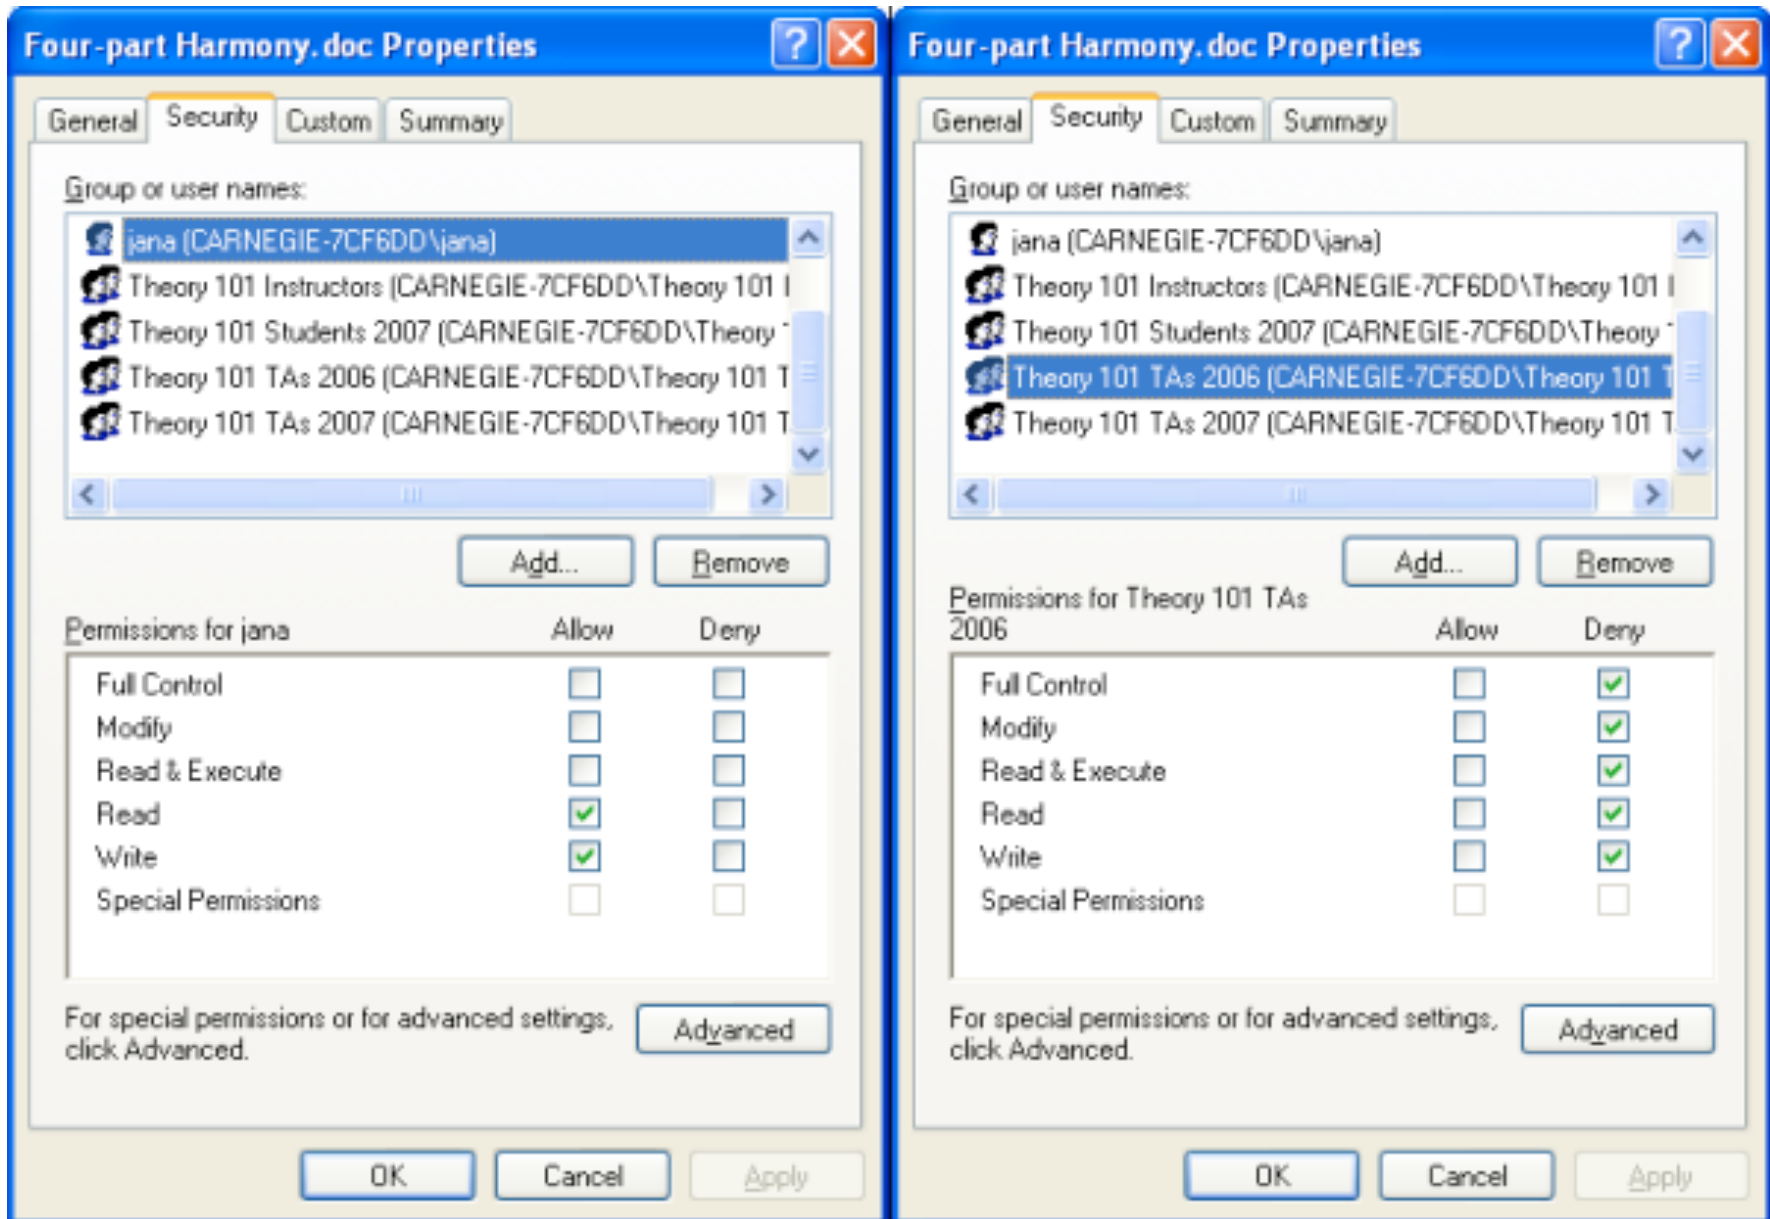

Easier to delegate rights

Harder to control the delegation

More difficult to implement

The “Zen of information security”

can jana read Four-part Harmony.doc?

can jana read Four-part Harmony.doc?

The screenshot shows the 'the eXpandable grid' application window. The main area displays a grid of permissions for various files and folders. The columns are labeled with user names: 'Theory 101 TAS 2006', 'chan', 'edna', 'henry', 'jana', 'kavita', and 'Theory 101 TAS 2007'. The rows are labeled with file names: 'Theory 101', 'Admin', 'Handouts', 'Four-part Harmony.doc', 'Musical Analysis1.doc', 'Musical Analysis2.doc', and 'Ditch Training.doc'. A legend on the left explains the grid symbols: a 2x2 grid for Read/Write/Execute/Delete, a green square for Allow, a red square for Deny, and a yellow square for Some access allowed. The 'Four-part Harmony.doc' row shows that 'jana' has Read (R) and Write (W) permissions, while others have various combinations of Read, Write, Execute, and Deny permissions.

Legend

Read Write
Execute Delete

Allow
Deny
Some access allowed

Subgrid shows:
 Read Write Execute
 Delete Administrate

THE UNIVERSITY OF BRITISH COLUMBIA

Security Policies

what's secure system?

- Secure system

 - Starts in authorized state

 - Never enters unauthorized state

If the system enters any of these states, it's a security violation

Authorized state in respect to what?

Policy partitions system states into:

 - Authorized (secure)

 - These are states the system can enter

 - Unauthorized (nonsecure)

THE UNIVERSITY OF BRITISH COLUMBIA

C I A

What's Confidentiality?

X set of entities, I information

I has confidentiality property with respect to X if no $x \in X$ can obtain information from I

I can be disclosed to others

Example:

- X set of students
- I final exam answer key
- I is confidential with respect to X if students cannot obtain final exam answer key

what's confidentiality policy?

Goal: prevent the unauthorized disclosure of information

Deals with information flow

Integrity incidental

Multi-level security models are best-known examples

Bell-LaPadula Model basis for many, or most, of these

What's Integrity?

X set of entities, I information

I has integrity property with respect to X if all $x \in$

X trust information in I

Examples?

Types of Access Control Policies

Discretionary Access Control (DAC, IBAC)

individual user sets access control mechanism to allow or deny access to an object

Mandatory Access Control (MAC)

system mechanism controls access to object, and individual cannot alter that access

Originator Controlled Access Control (ORCON)

originator (creator) of information controls who can access information

Multilevel Security (MLS) Models

Classifications and Clearances

Classifications apply to **objects**

Clearances apply to **subjects**

US Department of Defense uses 4 levels of classifications/clearances

TOP SECRET

SECRET

CONFIDENTIAL

UNCLASSIFIED

Clearances and Classification

To obtain a **SECRET** clearance requires a routine background check

A **TOP SECRET** clearance requires extensive background check

Practical classification problems

- Proper classification not always clear

- Level of granularity to apply classifications

- Aggregation — flipside of granularity

Subjects and Objects

Let O be an **object**, S a **subject**

O has a classification

S has a clearance

- o Security **level** denoted $L(O)$ and $L(S)$

For DoD levels, we have

TOP SECRET > SECRET > CONFIDENTIAL > UNCLASSIFIED

Multilevel Security (MLS)

MLS needed when subjects/objects at different levels use same system

MLS is a form of **Access Control**

Classified government/military information

Business example: info restricted to

- Senior management only

- All management

- Everyone in company

- General public

Network firewall

- Keep intruders at low level to limit damage

Confidential medical info, databases, etc.

Example

security level	subject	object
Top Secret	Alice	Personnel Files
Secret	Bob	E-Mail Files
Confidential	Chiang	Activity Logs
Unclassified	Fred	Telephone Lists

Alice can read all files

Chiang cannot read Personnel or E-Mail Files

Fred can only read Telephone Lists

Bell-LaPadula

BLP security model designed to express essential requirements for MLS

BLP deals with **confidentiality**

To prevent unauthorized reading

Recall that O is an object, S a subject

Object O has a classification

Subject S has a clearance

Security level denoted $L(O)$ and $L(S)$

BLP rules

Simple Security Condition: S can read O
if and only if $L(O) \leq L(S)$

***-Property (Star Property):** S can write
O if and only if $L(S) \leq L(O)$

No read up, no write down

Key Points Regarding Confidentiality Policies

Confidentiality policies restrict flow of information

Bell-LaPadula model supports multilevel security

Cornerstone of much work in computer security

Chinese Wall Model

What's Chinese Wall Model

Problem:

Tony advises American Bank about investments

He is asked to advise Toyland Bank about investments

Conflict of interest to accept, because his advice for either bank would affect his advice to the other bank

Organization

Organize entities into “conflict of interest” classes

Control subject accesses to each class

Control writing to all classes to ensure information is not passed along in violation of rules

Allow sanitized data to be viewed by everyone

Example

Bank COI Class

Gasoline Company COI Class

- If Anthony reads any Company dataset (CD) in a conflict of interest (COI), he can never read another CD in that COI
 - Possible that information learned earlier may allow him to make decisions later

THE UNIVERSITY OF BRITISH COLUMBIA

Role-based Access Control (RBAC)

RBAC

Access depends on role, not identity or label

Example:

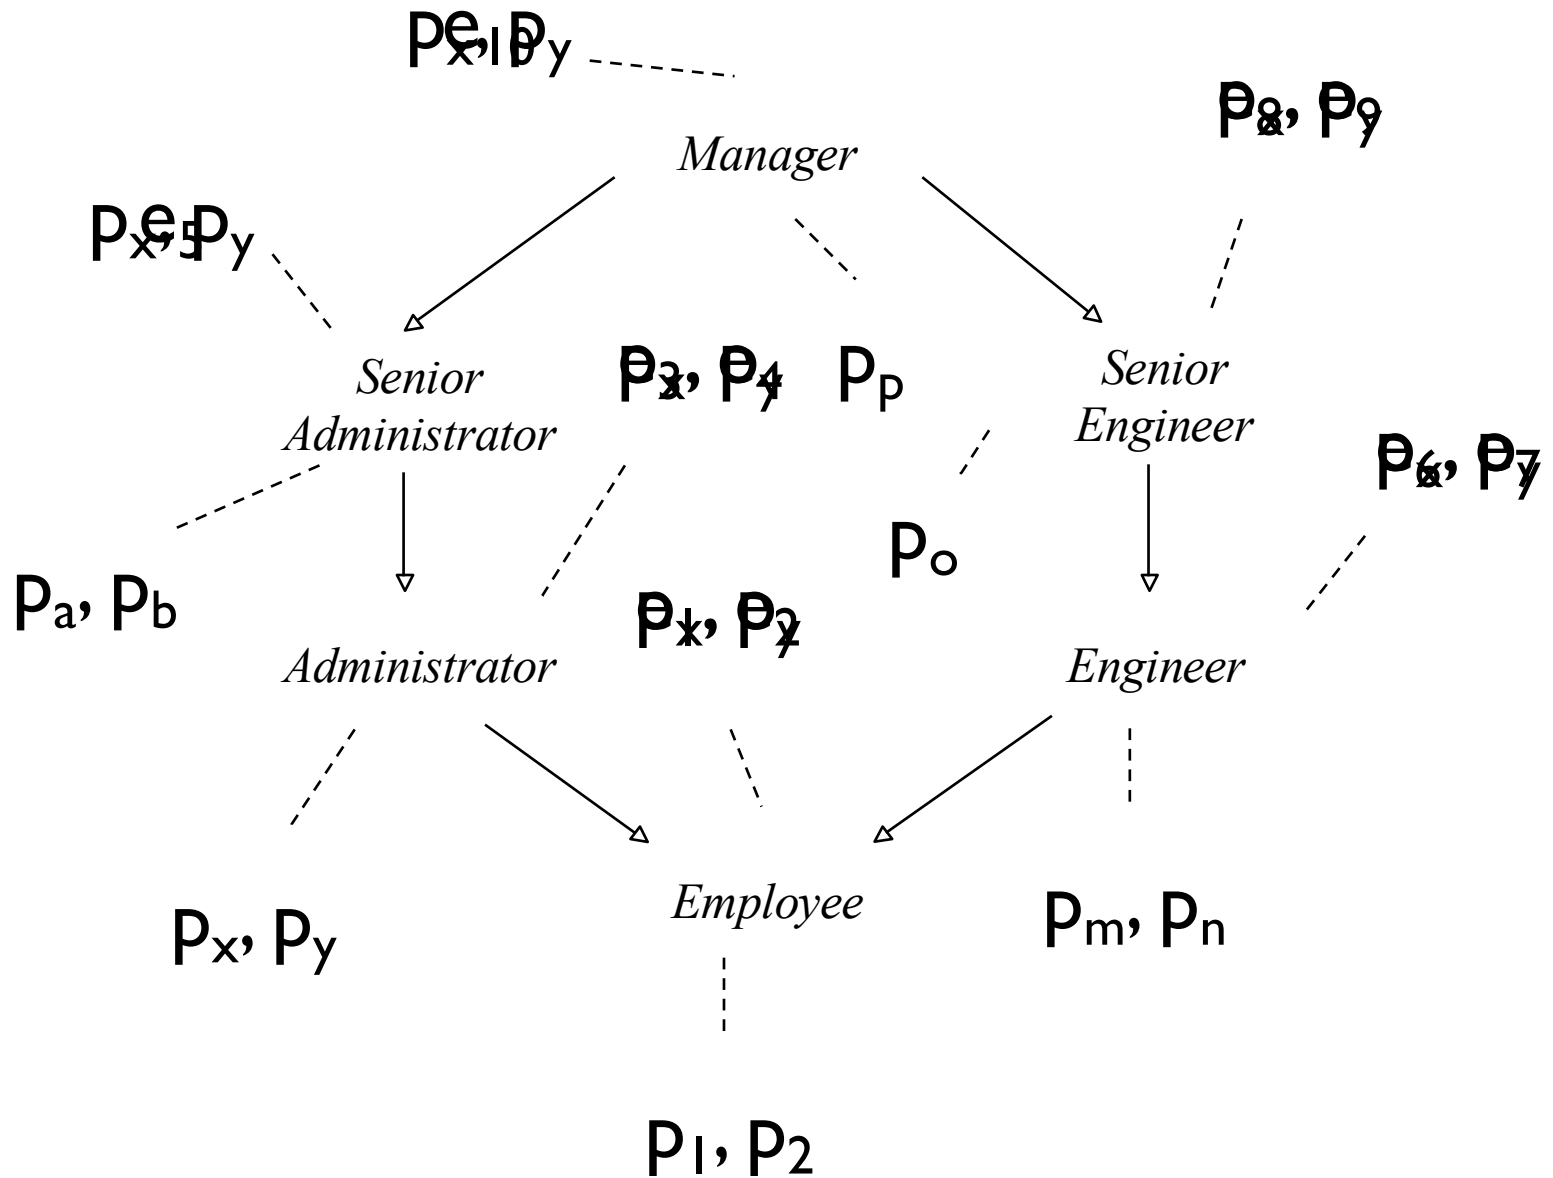

Allison, administrator for a department, has access to financial records.

She leaves.

Betty hired as the new administrator, so she now has access to those records

The role of “administrator” dictates access, not the identity of the individual.

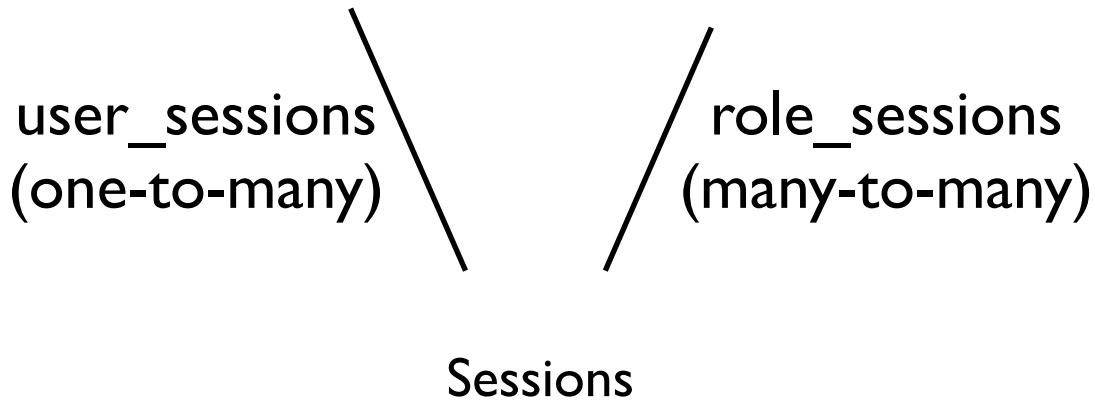

Example

RBAC (ANSI Standard)

Users $\xrightarrow{\text{UA}}$ Roles $\xrightarrow{\text{PA}}$

Operations \longleftrightarrow Objects

Permissions

RBAC with General Role Hierarchy

RH
(role hierarchy)

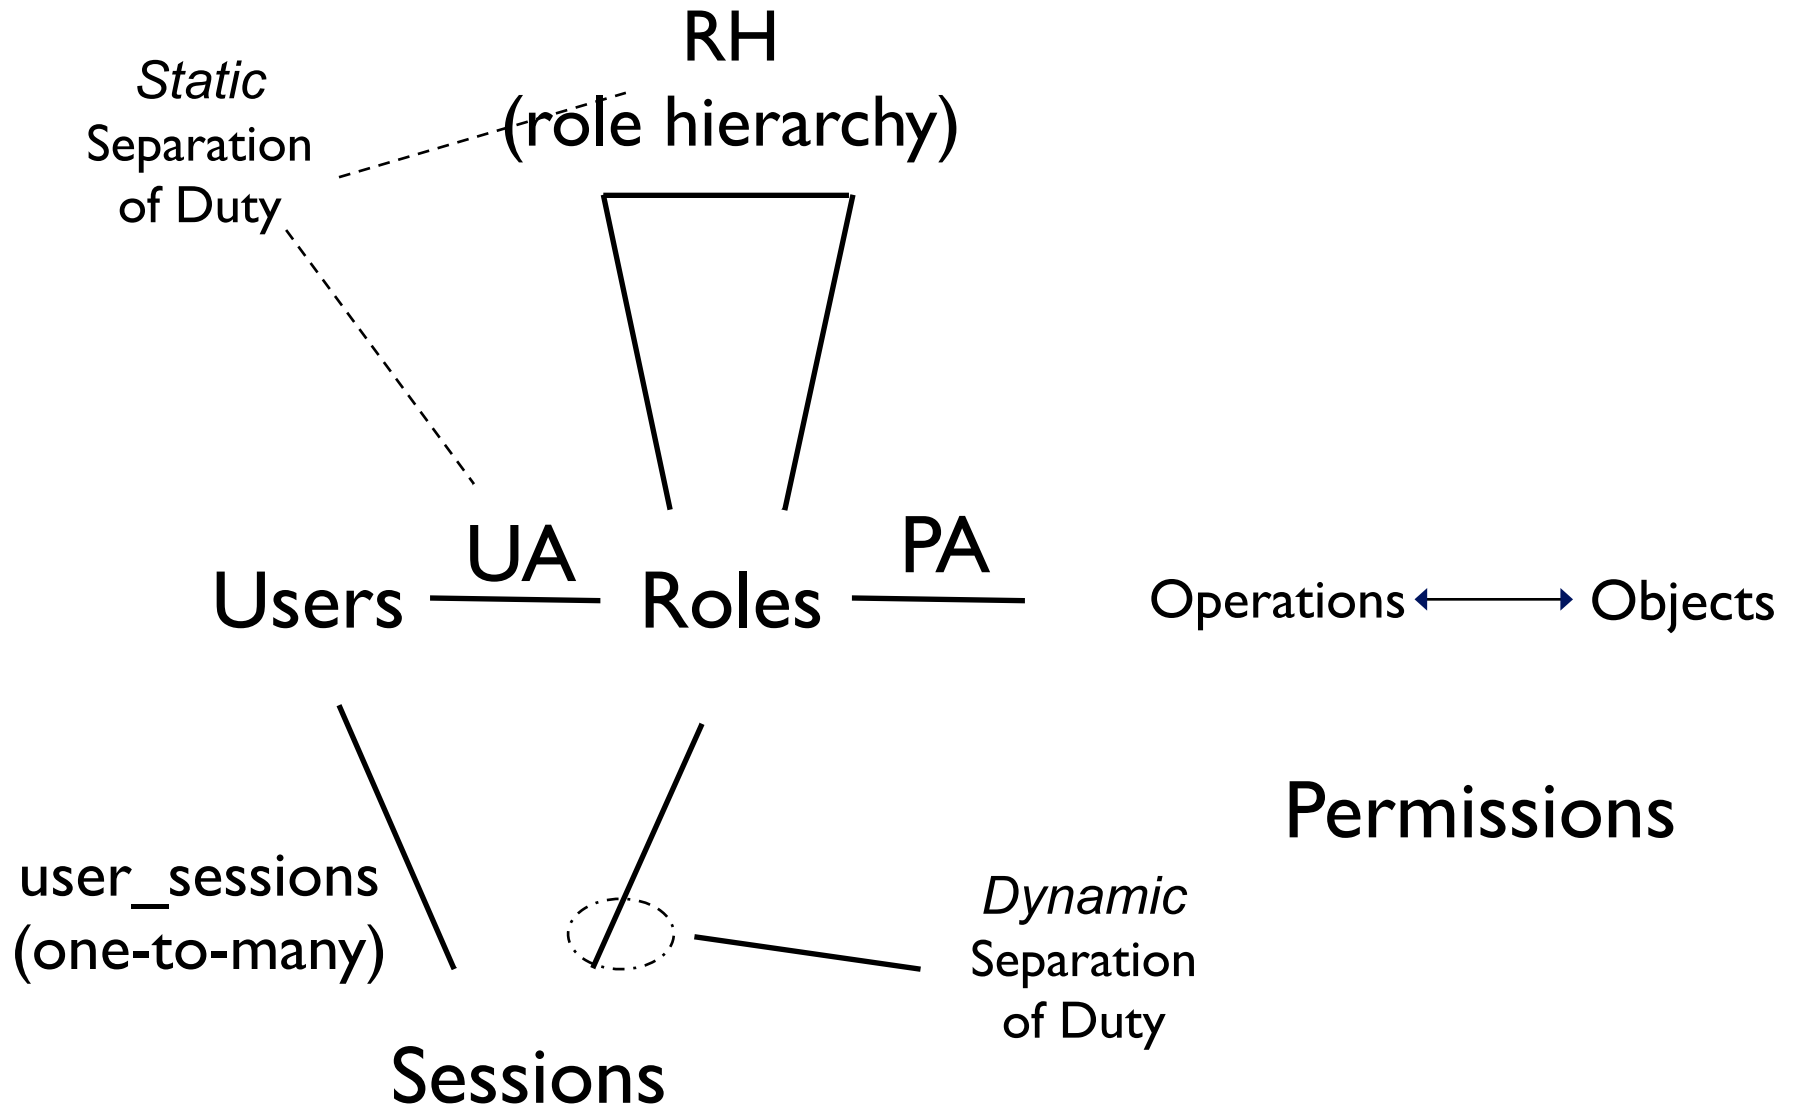

Operations \longleftrightarrow Objects

Sessions

Permissions

Constrained RBAC
