

# 1 Medici Configuration

Put the following in your `.cshrc.solaris` file in your root directory:

```
set path = ($path /CMC/tools/tcad/bin )
```

To activate in your current shell, type:

```
source ~/.cshrc.solaris
```

or just logout and login again.

A PDF version of the MEDICI manual is in the folder:

```
/nfs/kelowna/CMC/tools/tcad/manuals_pdf/medici_2002.4.0
```

Execute the command:

```
medici filename.inp
```

to run the simulation where *filename.inp* is a valid Medici input file. When the simulation is complete, at least one additional file will be present in your folder: *filename.out*. This file is a log of the simulation progress including the results of any `PRINT` statements from within the input file.

This should give enough information to get started using a Medici simulation. If you require further explanations, please consult the manuals or e-mail the TA, [lavej@ece.ubc.ca](mailto:lavej@ece.ubc.ca).
